GEOSPACE STORMS

# Mesoscale processes during geomagnetic storms: The future of observing the global geospace in mesoscale resolution

---

Matina Gkioulidou

*Johns Hopkins Applied Physics Laboratory (APL)*

[matina.gkioulidou@jhuapl.edu](mailto:matina.gkioulidou@jhuapl.edu)

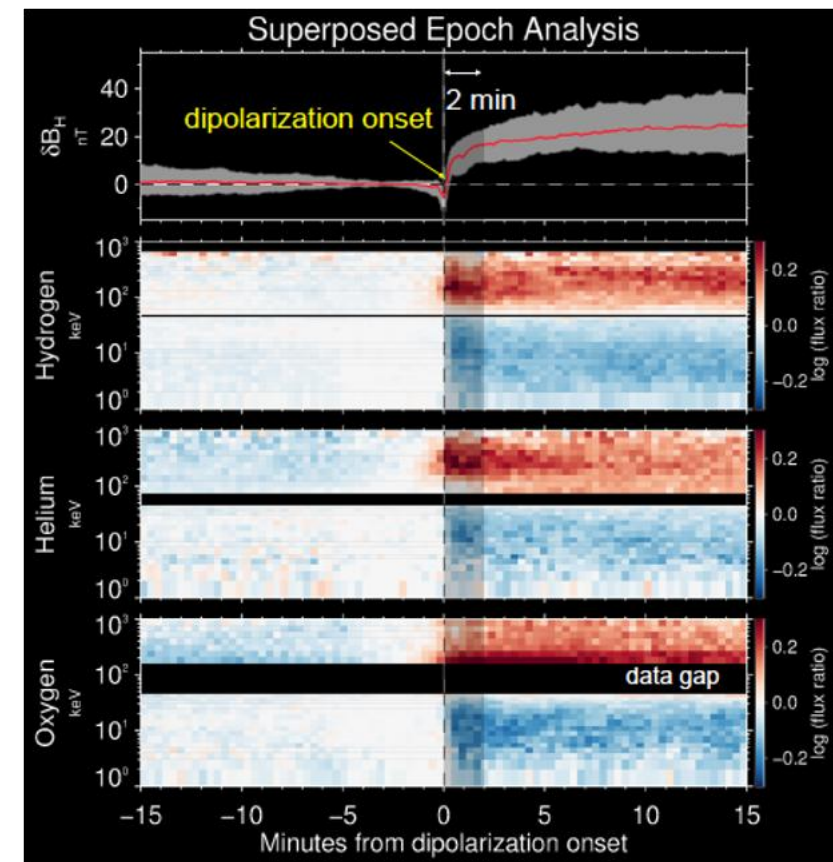

# WHAT WE KNOW: IN-SITU OBSERVATIONS OF MESOSCALE TRANSPORT IN THE PLASMA SHEET AND INNER MAGNETOSPHERE

*Runov et al., 2011 [JGR]:* Superposed epoch analysis of dipolarization fronts and the associated particle and BBF signatures *in the plasma sheet*, based on THEMIS data

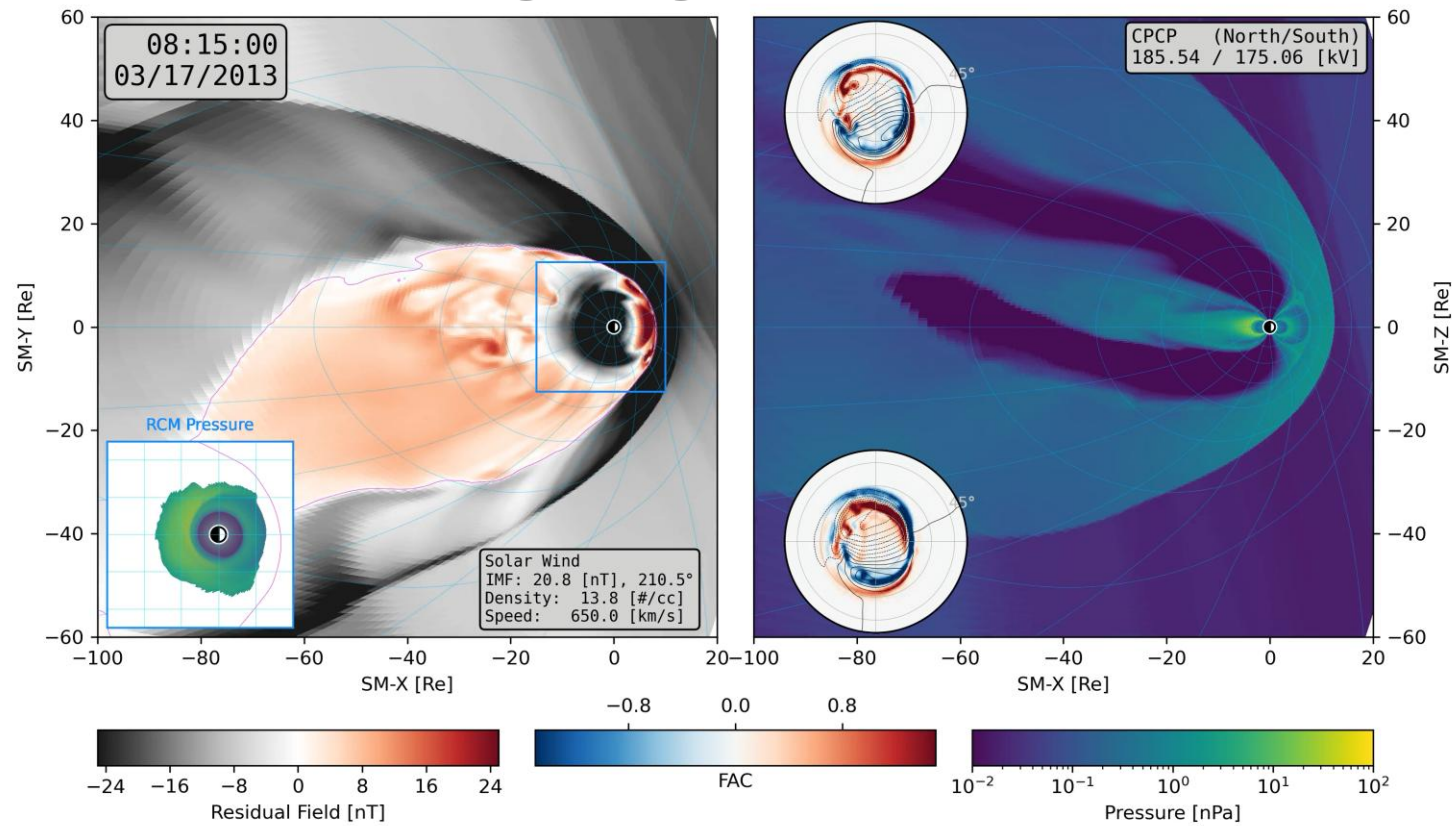

- *Plasma Sheet (~10-20  $R_E$  from Earth):*
  - Bursty Bulk Flows (BBFs),
  - Dipolarization Fronts (DFs),
- *Inner Magnetosphere (inside GEO):*
  - Energetic ion injections

*Motoba et al., 2018 [JGR]:* Superposed epoch analysis of dipolarization fronts *inside geosynchronous orbit* based on Van Allen Probes data

# WHAT WE KNOW: WHAT MODELS PREDICT

## Coupled GAMERA - RCM simulation of the March 13 2017 geomagnetic storm

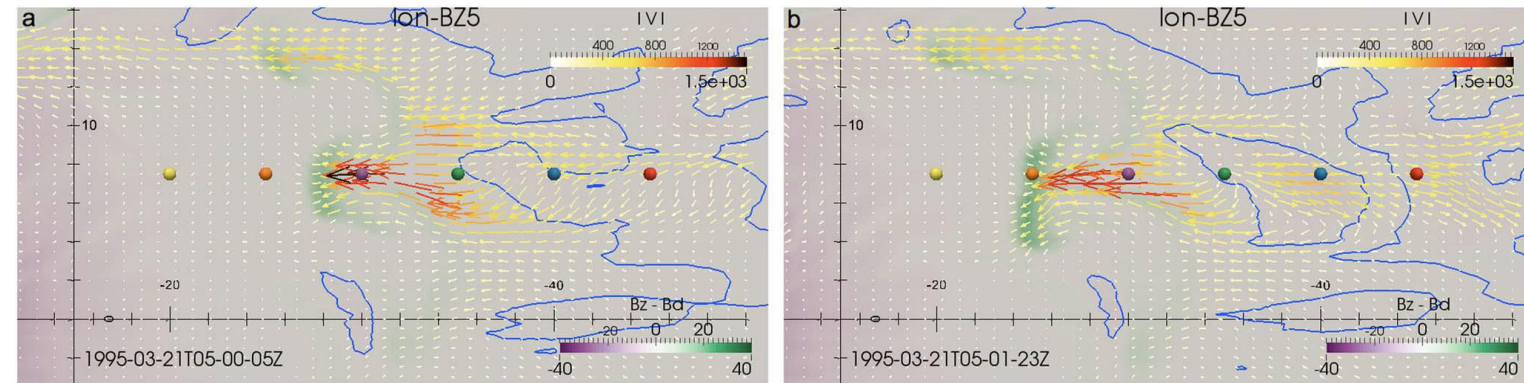

Simulations provide strong evidence that the plasma sheet mesoscale structures (BBFs/DFs) lead to energetic ion injections and contribute to the buildup of the storm-time ring current.

- *Yang et al., 2015 [JGR]* (RCM-E: inner magnetosphere self-consistent model)
- *Yu et al. 2014 [GRL]* (RAM-SCB coupled with BATS-R-US: inner magnetosphere model coupled with an MHD code)
- *Cramer et al., 2017 [JGR]* (RCM coupled with OpenGGCM: inner magnetosphere model coupled with an MHD code)
- *Ukhorskiy et al., 2018 [JGR]; Sorathia et al. 2021 [Frontiers]; Sciola et al. 2023 [JGR]* (GAMERA coupled with CHIMP and GAMERA coupled with RCM: MHD code coupled with particle tracing code and with an inner magnetosphere model)

# Comparing models to statistical studies of in-situ observations

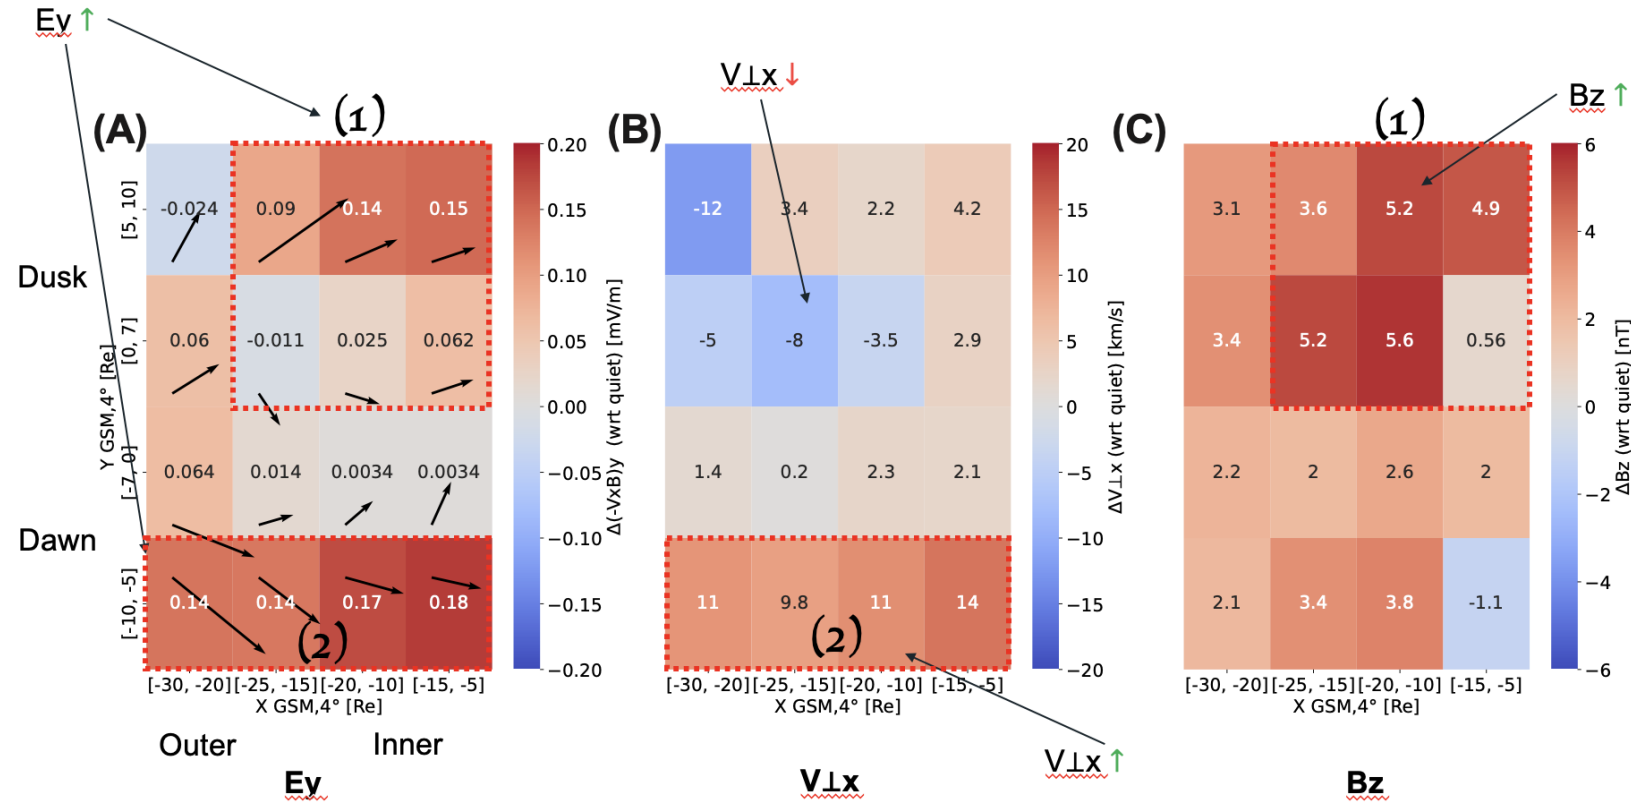

- Wiltberger et al., 2015 [JGR] vs Ohtani et al., 2004 [JGR]
  - LFM simulations: Superposed epoch analysis of the flows seen in the magnetotail during 90 min of sustained southward IMF in the solar wind.
  - This analysis used the same selection criteria as the Ohtani2004 analysis of Geotail observations.
  - BBF velocity, magnetic field, and density are qualitatively similar to those seen in the observations. However, there is a major difference in the density characteristics is the magnitude of the density drop after the BBF passage, attributed to the selection of data from the center of the LFM plasmasheet

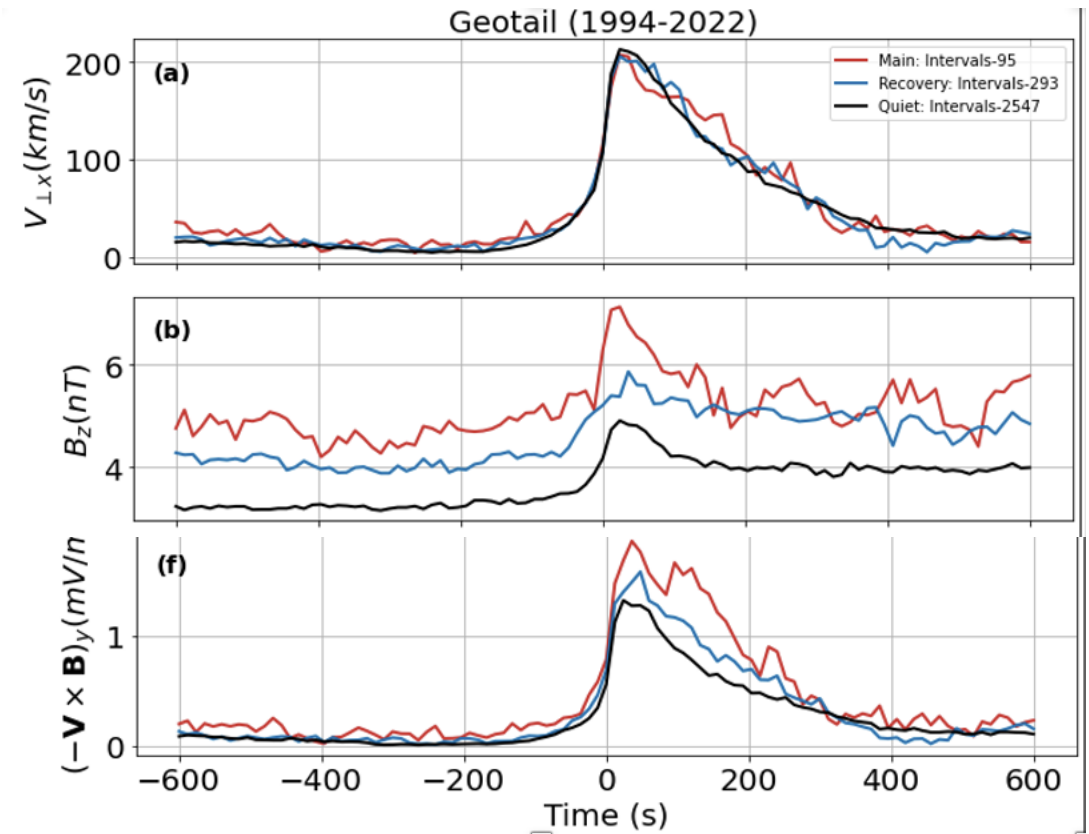

# Plasma Sheet Magnetic Flux Transport During Geomagnetic Storms

- *Raptis et al., 2024 [JGR]:* Statistical Geotail plasma sheet properties study (1994-2022); data chosen close to the central plasma sheet
- Plasma sheet properties normalized to quiet times, along with the median flow of ions during main storm phase.
- Elevated  $E_y$  at the Inner Dusk side and at the Dawn side, with very limited changes in the midnight sector.
- This elevated  $E_y$  is realized through a velocity enhancement at dawn and a  $B_z$  enhancement at the dusk
- Relatively lower velocity at the dusk side

# Superposed Epoch Analysis of Bursty Bulk Flows (BBFs) in the Plasma Sheet During Geomagnetic Storms

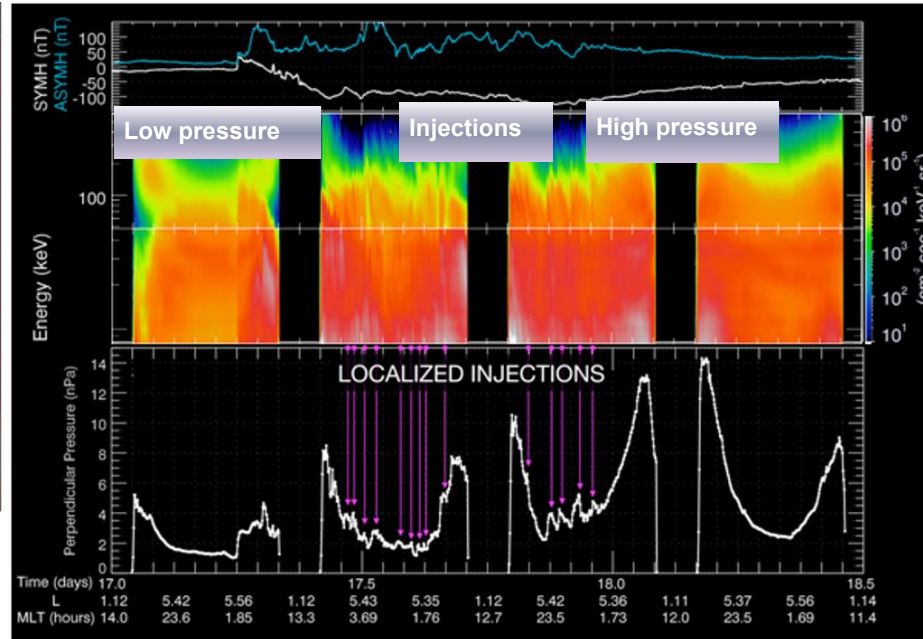

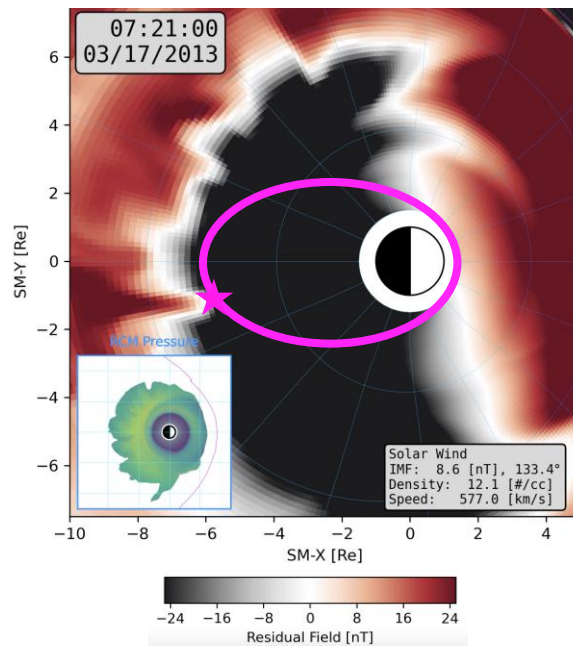

- Devanandan et al. (in prep): List of BBFs from the entire available Geotail dataset (1994-2022).
  - A BBF interval starts when  $V_{\perp x} > 100$  km/s and ends when  $V_{\perp x} < 100$  km/s with at least one point within the interval where  $V_{\perp x} > 250$  km/s.
  - $-15 \text{ RE} < \text{YGSM} < 15 \text{ RE}$  and  $-5 \text{ RE} < \text{XGSM} < -31 \text{ RE}$ .
- The variations of magnetic field and plasma parameters during BBFs are similar during storms and quiet time.
- No significant difference in  $V_{\perp x}$  is observed between storm-time and quiet-time BBF intervals.
- $B_z$  is elevated throughout the epoch window for storm-time BBFs due to enhanced magnetic field in the plasma sheet during storms.
- Comparing quiet-time and storm-time BBFs, the relative increase in magnetic flux transport is primarily due to an elevated magnetic field.

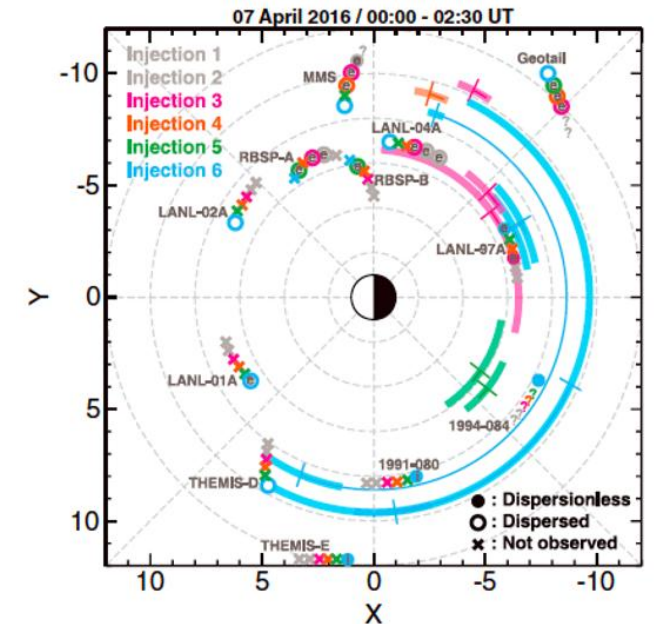

**Future work:** Do we find similar behavior in simulations?

# THE CHALLENGE

Assessing observationally the connection between mesoscale structures and inner magnetosphere injections the role of ion injections in building the storm-time ring current, due to spatially confined nature of the in-situ observations, which lack global context.

*Gkioulidou et al., 2014 [JGR]:* Attempt to estimate contribution of mesoscale injections to the ring current: ~30% with a lot of assumptions and caveats

*Turner et al., 2017 [JGR]:* Attempt to estimate injection extent and evolution using 16 (!) spacecraft (rather serendipitous conjunction): “Due to the discrepancy between the number, penetration depth, and complexity of electron versus ion injections, this event presents challenges to the current conceptual models of energetic particle injections”

Aug. 29, 2019: just a day after the tropical system became a hurricane

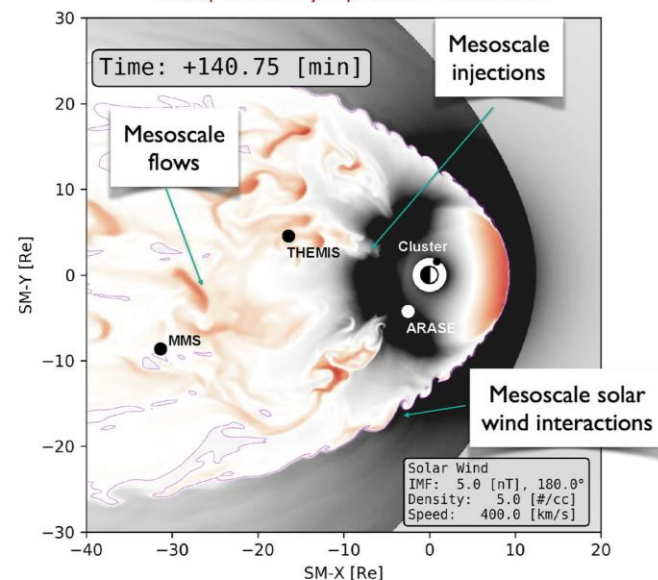

Sept. 3, 2019: dangerous, full blown storm began heading to the U.S. mainland

It's like trying to understand the evolution of a hurricane taking measurements from a single weather station. -Dave Sibeck

Sparse measurements, even if coordinated, are inadequate to fully capture the mesoscales.

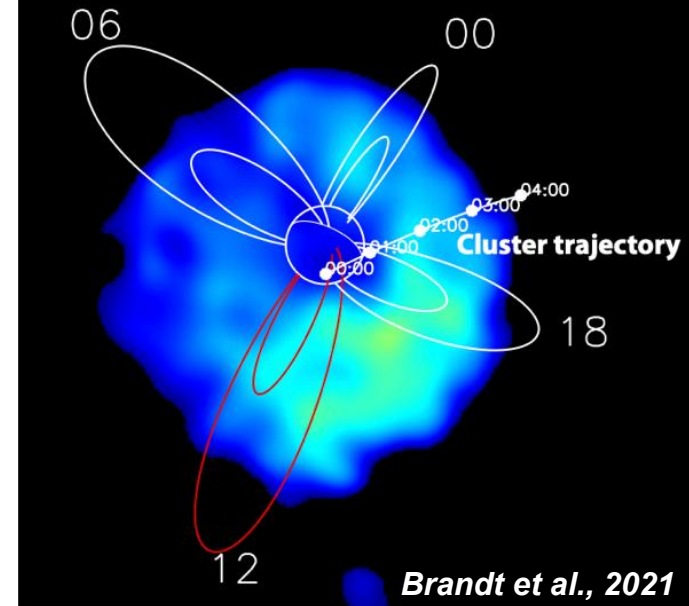

# SEEING IS BELIEVING: ENERGETIC NEUTRAL ATOM (ENA) IMAGING

The ENA emissions from ring current and plasma sheet are optically thin and can be expressed as line integrals of underlying ion distribution as they experience charge exchange with the geocorona.

We can “see” plasmas with ENA imaging

## ENA imaging vs in-situ observations

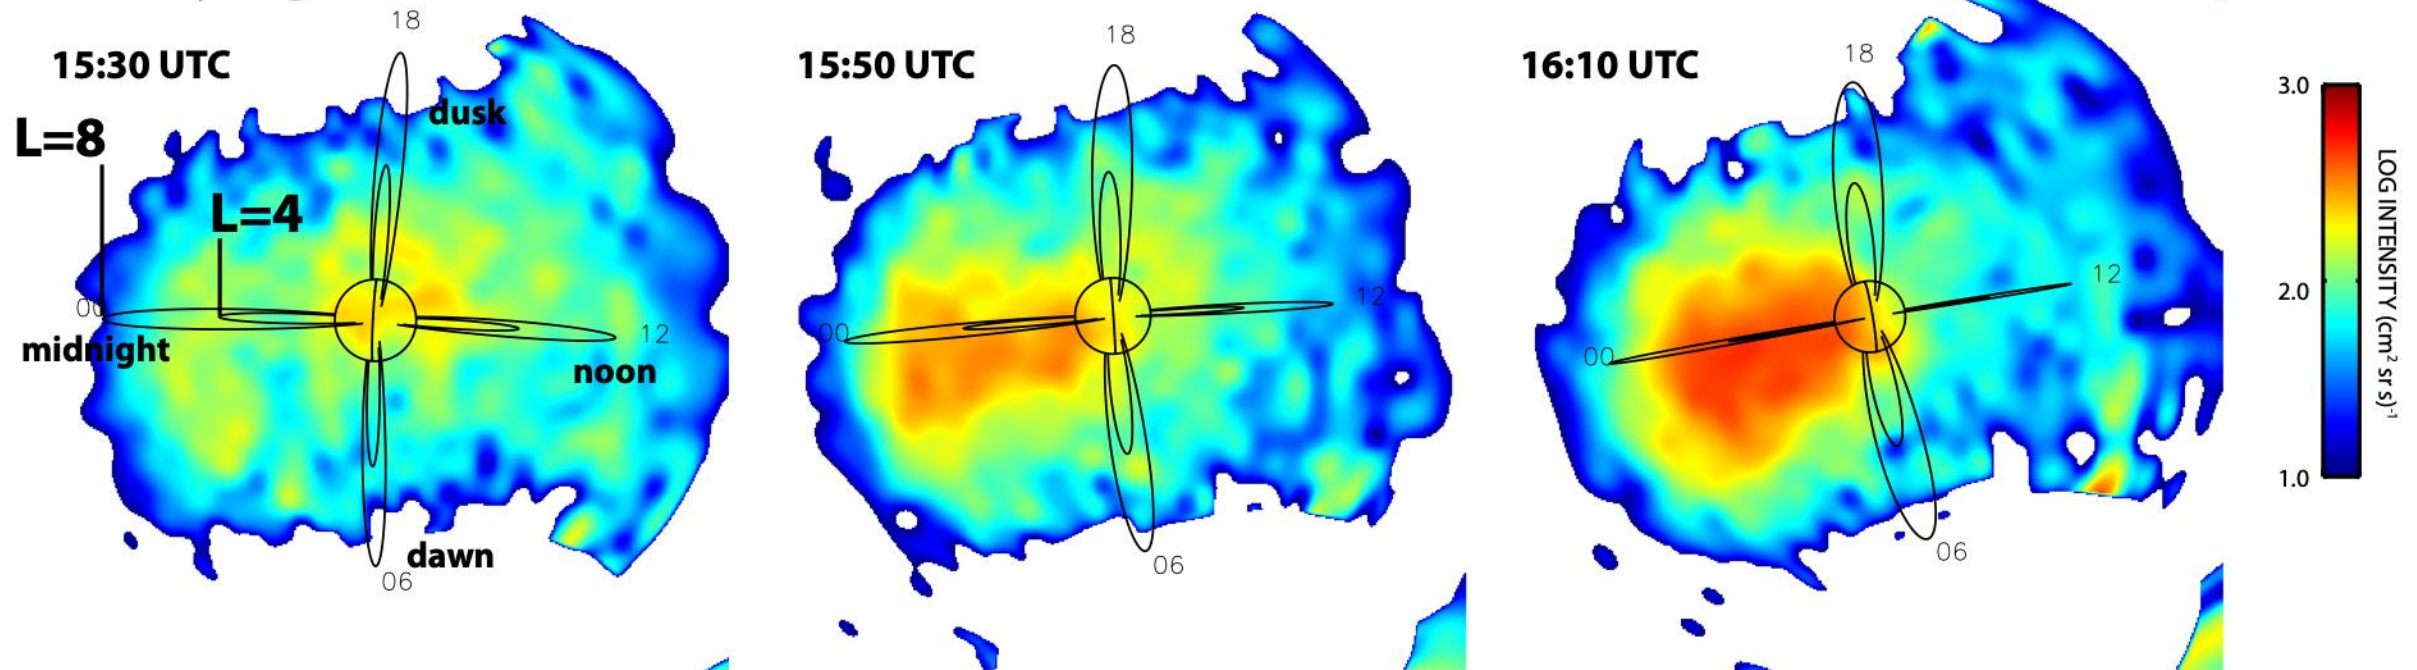

ENAs provide not only a global image of the ion distribution but also compositional and spectral information about that distribution, just like photons reveal information about their source

# LIMITED TEMPORAL AND SPATIAL RESOLUTION OF PREVIOUS ENA OBSERVATIONS

## Substorm injection of 24 September 2000 (DOY 268)

HENA Hydrogen 16-27 keV

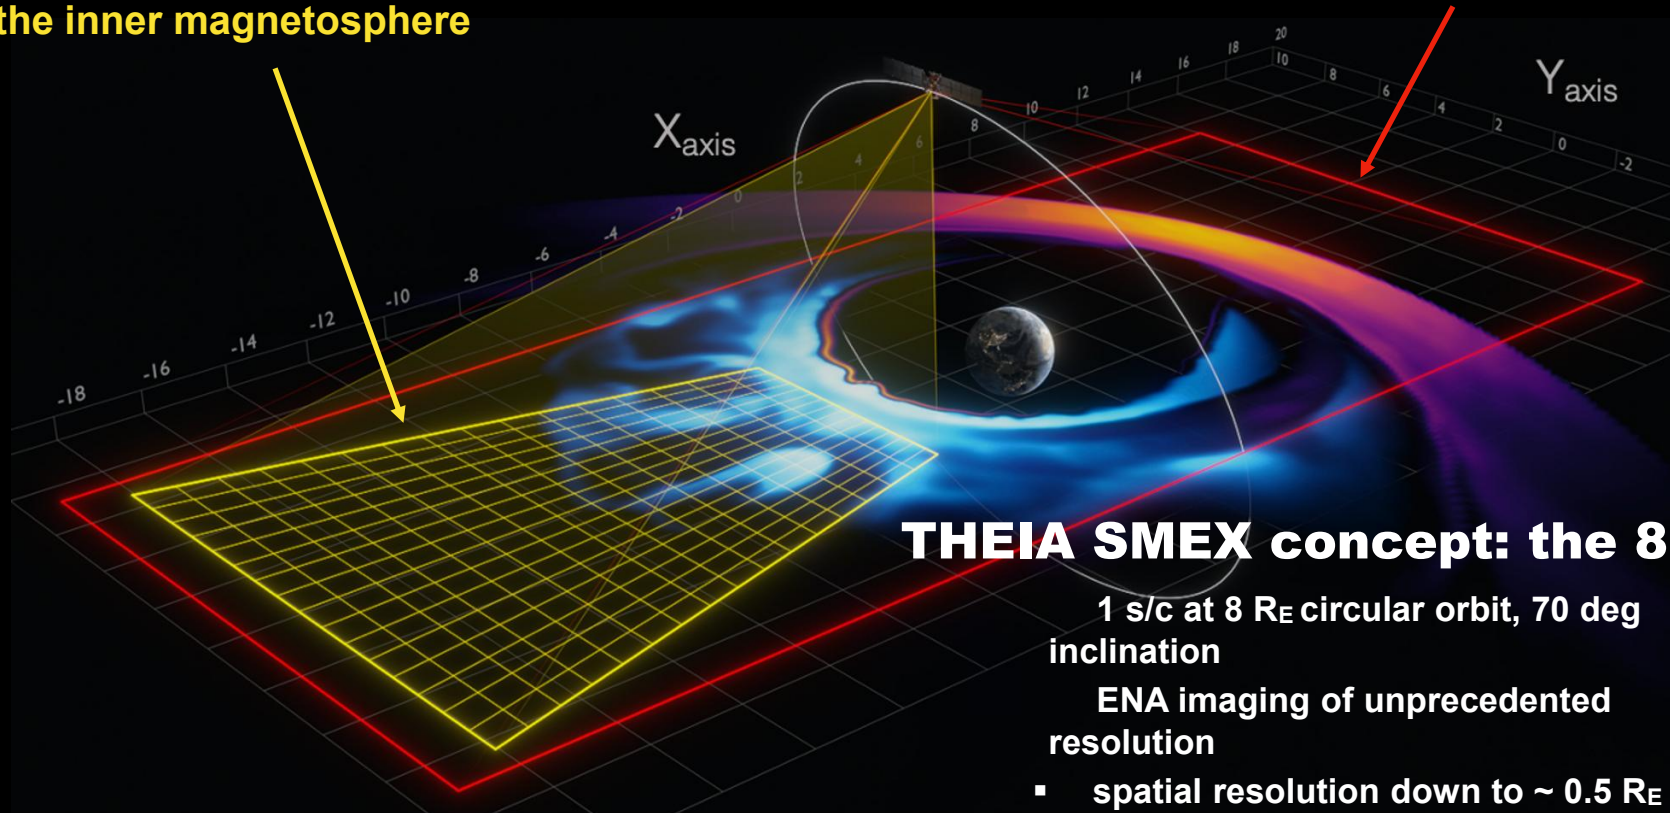

*Brandt et al., 2021*

# CAN WE OBSERVE MESOSCALE ION INJECTIONS WITH ENA IMAGING? *YES WE CAN!*

Narrow FOV ENA camera (NENA), with 10x higher sensitivity than any previously flown 2D ENA camera, captures mesoscale ion injections from the plasma sheet to the inner magnetosphere

Wide FOV Ring current ENA camera (WRENA) sees the buildup of the ring current (Heritage: JUICE/JENI, IMAP-Ultra)

## THEIA SMEX concept: the 8 $R_E$ view

1 s/c at 8  $R_E$  circular orbit, 70 deg inclination

ENA imaging of unprecedented resolution

- spatial resolution down to  $\sim 0.5 R_E$
- temporal resolution as fast as  $\sim 30$  sec

# Can we Observe Mesoscale Ion Injections with ENA Imaging?

## YES WE CAN!

We use as input ion fluxes inferred from MHD density and temperatures

MHD ion fluxes for  $E = 67$  keV

NENA "captures" the occurrence and evolution of mesoscale injections

NENA ENA count ratios  
counts(>40 keV)/counts(<40 keV)

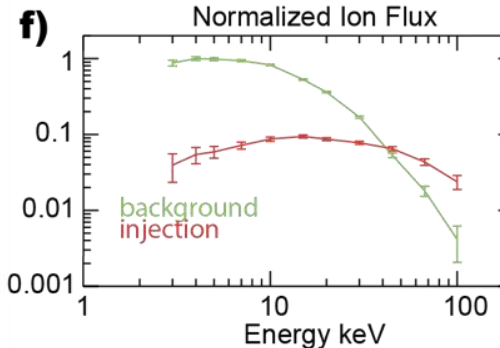

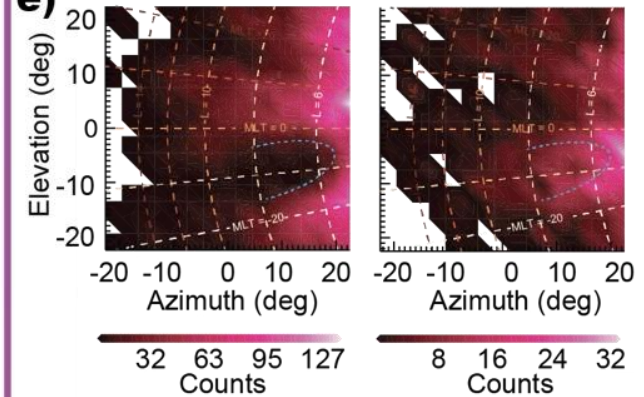

NENA ENA  
count ratios projected  
at the equatorial plane

**Observing System Simulation Experiment (OSSE)**, using MHD simulations ion fluxes as an input, demonstrates that the NENA ENA camera, from an example vantage point along a dawn-dusk oriented orbit, at  $YGSE = 0$ , can capture mesoscale ion injections and their properties as they move from the plasma sheet to the inner magnetosphere

NENA ENA counts  $E = 5$  keV NENA ENA counts  $E = 67$  keV

WRENA FOV NENA FOV

 $10^5$  Ion Flux /  $\text{cm}^2/\text{sec}/\text{sr}/\text{keV}$   
0.07 0.14 0.21 0.29  
NENA Count Ratio

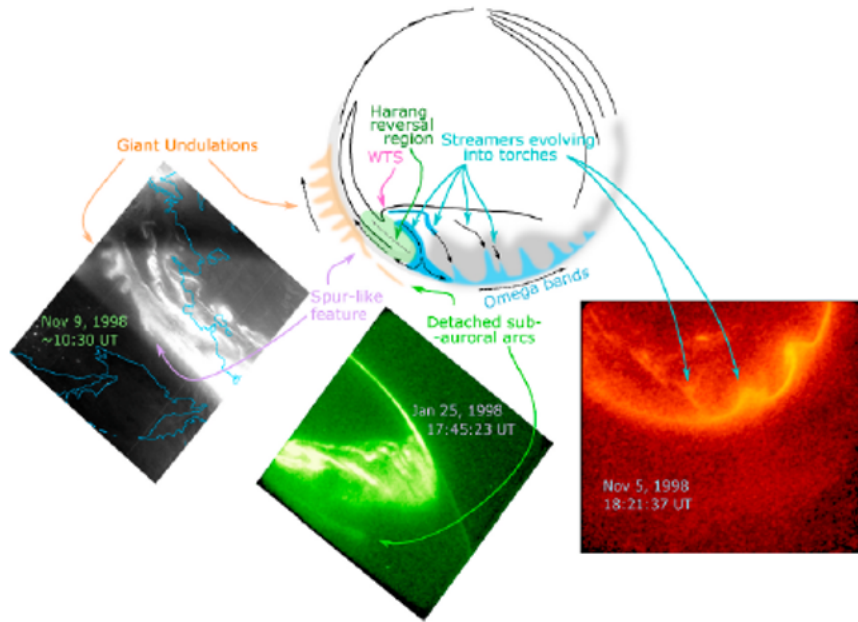

# Can we Observe Mesoscale Ion Injections with ENA Imaging?

## *YES WE CAN!*

# WHAT WE KNOW: MESOSCALE IONOSPHERIC/AURORAL PHENOMENA

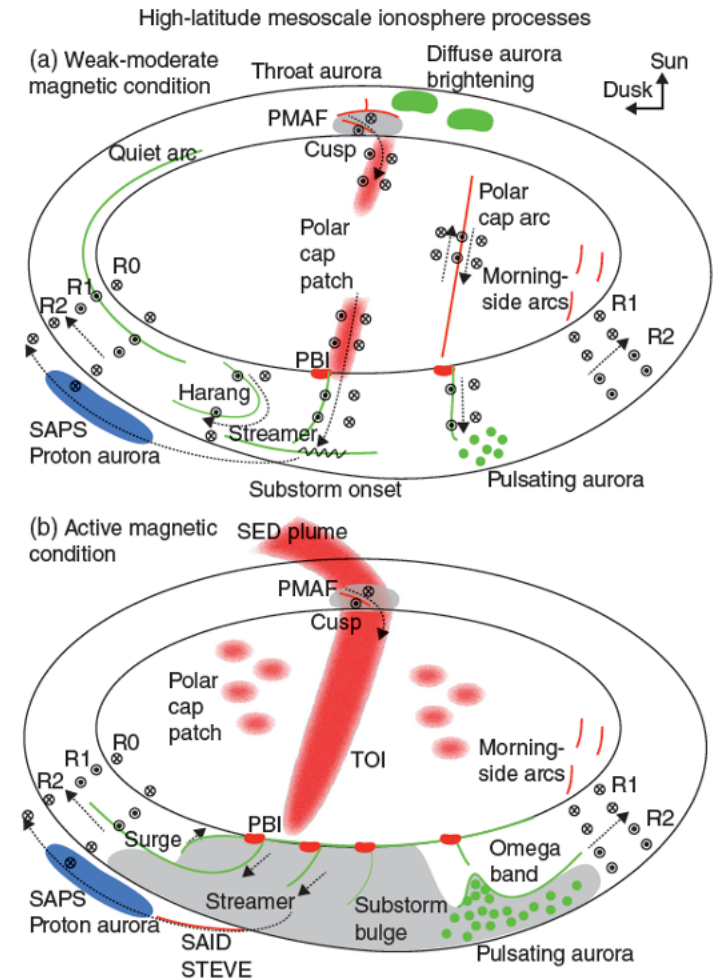

*Henderson et al., 2021 [Geophysical Monograph Series]*

Auroral phenomena, ranging from mesoscale auroral streamers to the global brightening of an auroral substorm, are a manifestation of both the energy deposition within the strongly coupled M-I system and the ionospheric conditioning itself.

Years of observations have uncovered myriad auroral mesoscale phenomena:

- Polar cap patches
- Poleward Boundary Intensifications (PBIs)
- Streamers
- Arcs
- Surges
- Omega bands
- Substorm beads
- Corresponding flow channels/Field Aligned Currents (FACs)/conductance.

*Nishimura et al., 2021 [Geophysical Monograph Series]*

# WHAT WE DON'T KNOW: RELATION BETWEEN MAGNETOSPHERIC MESOSCALE PROCESSES AND MESOSCALE AURORAL PHENOMENA

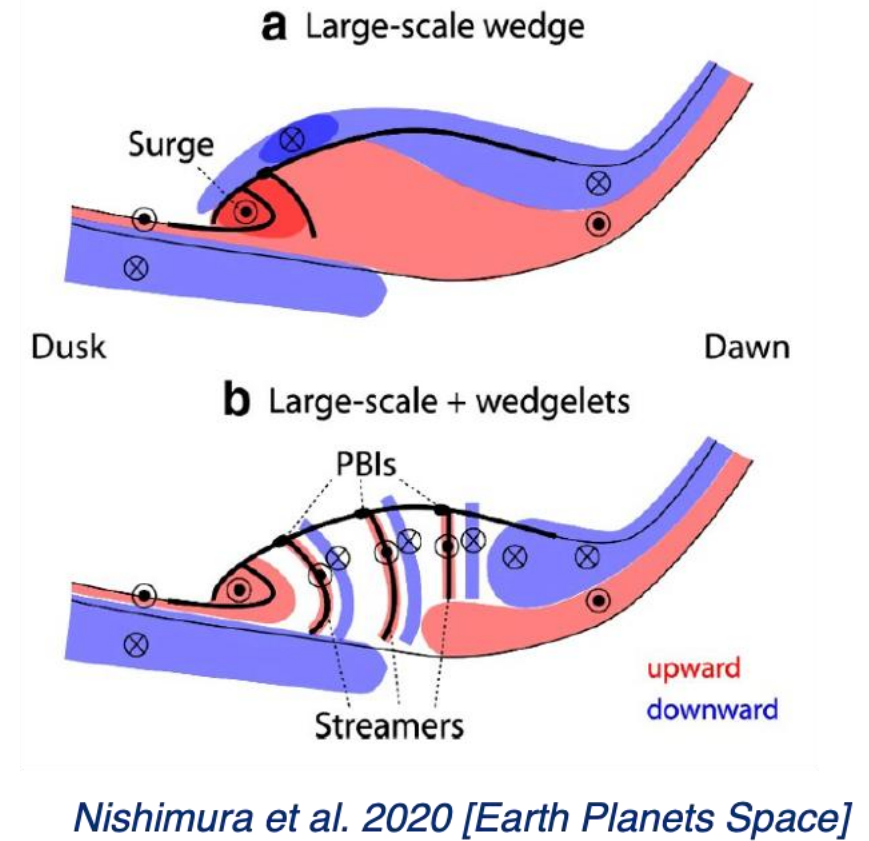

*Lyons et al., 2012 [Geophysical Monograph Series]*

## **For example:**

How do auroral streamers evolve spatially and temporally with respect to the plasma sheet mesoscale structures (BBFs, DFs, particle injections) under different geomagnetic conditions?

# THE CHALLENGE: ASSESSING OBSERVATIONALLY THE GLOBAL CONSEQUENCES OF MESOSCALE PROCESSES

- ❑ Is the Substorm Current Wedge (SCW) buildup a result of smaller scale upward and downward current systems driven by streamers (aka wedgelets) [Liu et al. 2015; JGR] or is it a globally coherent system, where wedgelets are probably not a primary constituent [Ohtani and Gjerloev 2020; JGR]?
- ❑ The mesoscale, fast burst component of the substorm evolution is a key factor in the excitation of Geomagnetically Induced Currents (GICs) during a geomagnetic storm [Kozyreva et al., 2018; Earth, Planets and Space].

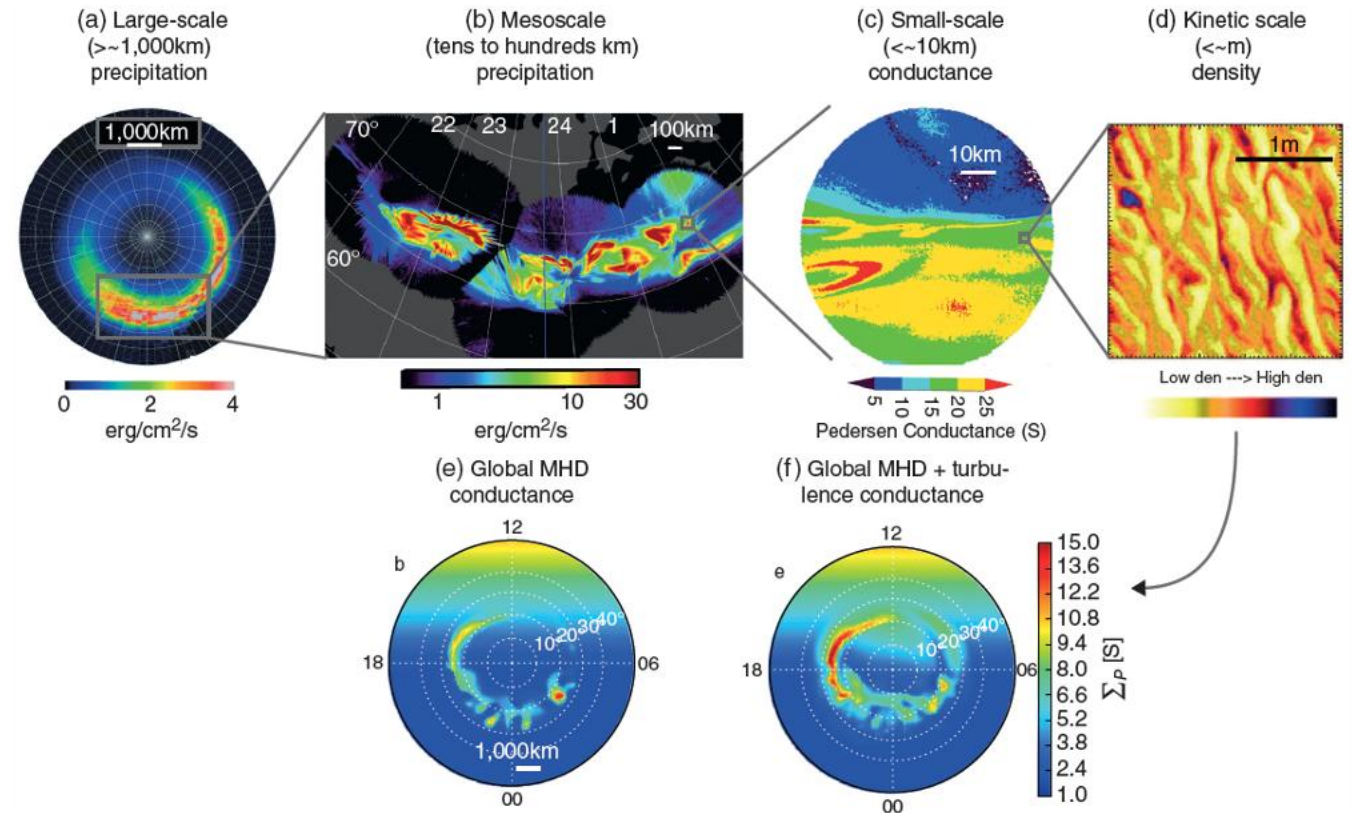

# THE CHALLENGE: ASSESSING OBSERVATIONALLY THE GLOBAL CONSEQUENCES OF MESOSCALE PROCESSES

Precipitation associated with mesoscale aurora, and its global effects is poorly understood. Using ground based auroral All-Sky Imagers:

- ▶ *Nishimura et al., 2021 [Geophysical Monograph Series]; Gabrielse et al., 2021 [Frontiers]*: significant mesoscale precipitation contribution to the total energy flux during expansion phase of substorm.

**However**, ground-based imaging cannot address how much mesoscale precipitation impact global total precipitation, or how mesoscale precipitation varies with the hemispheres and seasons.

*Nishimura et al., 2021 [Geophysical Monograph Series]*

# PARAGON: Plasma Acceleration, Reconfiguration, and Aurora Geospace Observation Network

Polar UVI observations of  
an auroral streamer

### PARAGON in a nutshell:

#### Remote sensing platforms:

- 3 three-axis-stabilized S/C in common, polar, circular orbit of 9  $R_E$  (magenta orbit)
- Unprecedented spatial and temporal resolution imaging of the ring current and the plasma sheet, the aurora, and the plasmasphere.
- Simultaneous, dual-hemisphere imaging of the auroral ovals

#### In-situ platforms:

- 4 spinning small satellites, in near-equatorial, elliptical orbits (yellow, green, cyan example orbits)
- Plasma, energetic particles, and magnetic field measurements

<https://doi.org/10.3847/25c2cfef.973ef1d2>

# Magnetospheric Constellation (MagCON)

Orbit	Apogee (RE)	Perigee (km)	Period (hours)	Deorbit (m/s)
A (blue)	8.24	6,237	16.26	422
B (yellow)	10.79	3,725	21.67	239
C (cyan)	15.00	1,400	32.52	99

- 36 spacecraft
- Plasma, Magnetic Field measurements & Energetic particles

# PARAGON + MagCON = Links

## Links Mission

### Links:

MagCon Constellation

PARAGON Constellation

### Key Features:

- **MagCon (24 satellite constellation)**
  - **Payload:** Magnetometer (MAG), Solid State Telescope (SST), Electrostatic Analyzer (ESA), Charge/Discharge Sensor (CDS)
  - **Flight System:** 39-month life spacecraft, S-band communications up to 2.5 Mbps, Hydrazine propellant system, microsat avionics, spinning satellite, powered by body-mounted solar panels
- **Launch:** Vulcan VC4S, injection orbit: 1.1Re x 10.79 Re at 10 deg inc, nominal launch: 2031
- **Orbits:** A: 1.49Re x 8.24Re, B: 1.29Re x 10.79Re, C: 1.11Re x 15Re at 10 deg inclination
- **PARAGON (2 satellite constellation)**
  - **Payload:** Energetic Neutral Atom Wide Angle Camera (ENA WAC), Energetic Neutral Atom Narrow Angle Camera (ENA NAC) x 2, Far Ultraviolet Imager (FUV) x 2, Charge/Discharge Sensor (CDS)
  - **Flight System:** 39-month life spacecraft, S-band communications up to 4.5 Mbps, Hydrazine propellant system, smallsat avionics, 3-axis stabilized, powered by deployed solar panels
- **Launch:** Falcon 9, nominal launch: 2031
- **Orbit:** 9Re circular at 70-90 deg inclination

### Scientific Objectives:

- Discover, quantify, and understand the global impact of mesoscale processes in the flow of mass, momentum, and energy through geospace
- Understand mesoscale energy input at the dayside magnetopause and flanks (e.g., the extent and temporal evolution of magnetopause reconnection)
- Understand the global impact of mesoscale magnetospheric energy flow:
  - How do plasma sheet mesoscale structures transport and energize plasma from the plasma sheet to the inner magnetosphere? Under what conditions and to what extent do they contribute to the buildup of the storm-time ring current?
- Observe the global impact of mesoscale MI coupling:
  - How does the aurora respond to transient mesoscale plasma sheet structures?

### Key Challenges:

- Capacity for building a fleet of 24 MagCon instrument suites and spacecraft may exceed the resources of many potential suppliers
- High tempo early orbit operation of a 24 MagCon satellite constellation in highly elliptical 10 deg inclined orbit without crosslinks and with limited direct communications capability

Technical Risk Rating is Medium-Low 

PARAGON = Plasma Acceleration, Reconfiguration, and Aurora Geospace Observation Network  
MagCon = Magnetospheric Constellation

# AURORAL MANIFESTATION OF SATURN PERIODIC INJECTIONS

Can Saturn's corotational magnetospheric periodicity be driven by radial interchange injections?

Caggiano, Sciola+ 2024

# SATURN PERIODIC INJECTIONS & RADIO EMISSIONS

## Hot-Plasma Injection observed by Cassini INCA at Saturn

- Correlation between Saturn large-scale injections (observed by Cassini/INCA ENA camera) and kilometric radiation (Wing et al., 2020; Brandt et al., 2021)
- Are large-scale injections the engine behind periodic planetary radio emissions?
- Is this a universal process and can we apply it observed radio periodicities at brown dwarfs?

# JUPITER ICY MOONS EXPLORER (JUICE) MISSION

## JUICE'S SCIENCE INSTRUMENTS

Juice will carry ten state-of-the-art instruments, including the most powerful remote sensing, geophysical and in situ payloads ever flown to the outer Solar System. Nine of the instruments are led by European partners, and one by NASA. Juice also includes an experiment called PRIDE, which will perform precise measurements using radio telescopes on Earth.

● In situ instruments ● Remote sensing instruments ● Geophysical instruments ● Experiment

Optical camera system (JANUS)

Visible and infrared imaging spectrometer (MAJIS)

UV imaging spectrograph (UVS)

Sub-millimetre wave instrument (SWI)

Radar sounder (RIME)

Planetary Radio Interferometer & Doppler Experiment (PRIDE)

Juice will also carry a radiation monitor (RADEM)

Laser altimeter (GALA)

Radio science experiment (3GM)

Magnetometer (J-MAG)

Particle environment package (PEP)

Radio and plasma wave instrument (RPWI)

# Bringing it back to Earth: In Conclusion?

---

- Simulations have outrun observations!
- Huge leaps in high resolution global model development in the last decade give us predictions of how nature might be working
- We need to be as bold and visionary with our future space missions, in order to acquire the observations that will tell us how nature really works
  - multipoint observations combining both in-situ and remote sensing of the coupled magnetosphere-ionosphere system
